

# INDIANAPOLIS CEDIA 2003

Custom Electronic Design and Installation Association

**Intelligent Audio Systems, Inc.** showcased their IA-643 subwoofer that claims to be the world's first self-installing and self-adjusting audio loudspeaker. According to Intelligent Audio's co-founder Ken Kantor, "One of the biggest remaining obstacles to ideal loudspeaker performance is controlling how speakers interact with each individual listening room. Intelligent Audio breaks that barrier with our RADS technology... audio "artificial intelligence" that enables a computer to hear the way the human ear does." The on-board "X-Scale" processor analyzes the input and output hookup, then automatically adapts the system for operation. It calculates the exact match for the existing loudspeakers and room, thereby making the appropriate corrections.
